

## TASK DETAILS:

Implement the Open weather map APIs and develop a weather app.

## Constraints:

- Get the current weather data by passing a city(get input from the user).
- Display the below values in the output
  - 1)Temp
  - 2)Weather Description
  - 3)Weather Icon

## How do I complete the task?

- Create a React App.
- Have a component to get the city input from the user.
- Make an api call once the city has been submitted by the user.
- Render the above given output values in another component.

### 1. Any specifications and constraints?

Front-End: **React**

#### Basic requirements:

- The code should be clean with proper variables, components and function naming and proper comments.

### 2. Any basic hints to solve?

- <https://reactjs.org/>
- <https://openweathermap.org/>
- <https://openweathermap.org/api>
